Publication No. US20050249727A1
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Schenk, Dale B.
APPLICANT: Neuralab Limited
TITLE OF INVENTION: Prevention and Treatment of Amyloidogenic Disease
FILE REFERENCE: 15270J-004740US
CURRENT APPLICATION NUMBER: US/10/923,605
CURRENT FILING DATE: 2004-08-20
PRIOR APPLICATION NUMBER: US/09/322,289
                                                                                                                                                                                                                                                                                                                                   Sequence

"Crystal structures of cyanide complexes of P450cam and the oxygenase domain of inducible nitric oxide synthase - structural models of the short-lived oxygen complexes.";

Arch. Biochem. Biochem. 409:15-11(203).

-IFUNCTION: Produces nitric oxide (NO) which is a messenger molecule with diverse functions throughout the body. In macrophages, NO mediates tumoricidal and bactericidal actions.

-ICATALYTIC ACTIVITY: L-arginine + n NADPH + m O(2) = citrulline + nitric oxide + n NADP (+).
   -I- COFACTOR: FAD. Binds 1 mole of FAD.
-I- COFACTOR: FMN. Binds 1 mole of FMN.
-I- COFACTOR: Metraphydrobiopterin (BH4). May stabilize the dimeric form of the enzyme.
-I- ENZYME REGULATION: Not stimulated by calcium/calmodulin. Aspirin

The present invention relates to a new method of inhibiting cerebral amyloid angiopathy. The new method of the invention involves contacting a blood vessel wall cell with an amyloid-beta40 inhibitor. The invention can be used for treating disease states characterised by cerebral amyloid angiopathy, particularly Alzheimer's disease, hereditary cerebral amyloid memorrhage with amyloidosis of the Dutch type and haemorrhagic stroke. The present sequence represents one of a group of peptides (AAVI1648-AAVI1669, AAVI1910 & AAVI1911) that were used in the invention as a carrier for the amyloid-beta40 (Abeta40) inhibitor. The Abeta40 inhibitor was used in the invention to treat a disease state characterised by cerebral amyloid anglopathy (CAA)
   ö
   Inhibiting cerebral amyloid angiopathy used for treating e.g. Alzheimer's disease comprises contacting blood vessel wall cell with amyloid-beta 40 inhibitor.

  The invention relates to an amyloid-targeting imaging agent comprising an amyloid targeting molety, a linker moiety and a labelling moiety. The agent is of general formula A t. (A_1 n. k) z-A_1 a. b. (1) where z = 0 - 1; A t. a n amyloid targeting molety, A_1 n. k = a linker moiety, and A_1 a diagnosing an onety. Also included are imaging amyloid deposition or administering (1) to the patient, and ultrasound imaging (1) in the patient to determine the presence of amyloid or amyloid-related condition is and a kit for preparing a radiopharmaceutical preparation comprising in a reducing agent, a buffering agent, a transchelating agent, and
not only reduces the formation of neurotoxic aggregates but also have the bablilty to reduce the neurotoxicity of performed A-beta fibrils. The present sequence represents a beta-AP peptide, which is used in the exemplification of the present invention
  New amyloid-targeting imaging agents useful for in vivo imaging amyloid plaques and/or for the treatment of amyloidosis disorders.

instructions for the preparation and use of the radiopharmaceutical in the imaging of amyloid or an amyloid-related condition. The agents are used for imaging amyloid deposition and for diagnosing an amyloid related condition e.g. Creutzfeldt-Jakob disease (GJD), kuru, transmissible cerebral amyloidoses (transmissible virus dementias), familial GJD, scraple, transmissible mink encephalopathy, bovine spongiform encephalopathy (BSB), inflammation-associated amyloid, type II diabetes, primary amyloidosis, feline spongiform encephalopathy, non-transmissible cerebral amyloidosis, Alzheimer's disease, prion-mediated diseases, dialysis-related amyloidosis, light chain-related amyloidosis, ight chain-related amyloidosis, ight chain-related amyloidosis, light chain-related amyloidosis, light chain-related amyloidosis. Present are capable of crossing the blood-brain barrier and are capable of binding specifically to amyloid plaques. The present sequence is a peptide forming the amyloid targeting moiety of the agent of the invention
   Human; islet amyloid polypeptide; IAPP; antifibrillogenic; amylin; fibrillar accumilation; amyloidosis; diabetes; cytoprotection; nootropic; chronic infection; tuberculosis; inflammation; rheumatoid arthritis; fever; neurodegenerative disease; scrapie; neuroprotective; antipyretic; bovine spongy form encephalitis; Creutzfeldt-Jacob disease; amyloid-beta; Alzheimer's disease; cerebral amyloid angiopathy; anti-diabetic; tuberculostatic; antiarthritic; antirheumatic; cerebroprotective.
  The present invention relates to antifibrillogenic agents (ABB83281-
BAB83299), derived from human islet amyloid polypeptide (TAPP, ABB83307).
The present sequence is a peptide fragment of the amyloid-beta (Abeta)
peptide. Aggregation of IAPP, also known as amylin, or Abeta results in
fibrillar accumulations, leading to amyloidosis. The antifibrillogenic
peptides prevent fibril formation and amyloidosis and hence control
folding or deposition of amyloid proteins. The antifibrillogenic peptides
   New antifibrillogenic peptide useful for inhibiting amyloidosis and/or for cytoprotection in the treatment of amyloidosis disorders e.g. type I or type II.

Amyloid modulator useful for treating a disorder associated with amyloidosis, comprises an amyloidogenic protein and/or a peptide fragment coupled to a modifying group.

Example 12; Page 35; 41pp; English.

protein and/or peptide fragment coupled to a modifying group so that the compound modulates the aggregation of natural amyloid proteins or peptides. The modulator is used for treating a disorder associated with amyloidosis e.g. familial amyloid polyneuropathy (Portuguese, Japanese and Swedish types), familial amyloid polyneuropathy (Portuguese, Japanese and Swedish types), familial amyloid cardiomyopathy (Portuguese, Japanese consolated cardiac amyloid, systemic senile amyloidosis, scrapis, bovine spongiform encephalopathy, Creutzfeldt-Jakob disease, adult onset diabetes, Gerstmann-Straussler-Scheinker syndrome, insulinoma, isolated atronglobulinaemia-associated amyloidosis, myeloma or macroglobulinaemia-associated with Sjogren's syndrome, reactive nodular amyloidosis, familial Mediteranean Fever and familial amyloid nephropathy with urticaria and deafness (Muckle-Wells syndrome), hereditary cerebral haemourhage with amyloidosis of Icelandic type, invention describes an amyloid modulator comprising an amyloidogenic amyloidosis associated with long term haemodialysis, hereditary non-neuropathic systemic amyloidosis (familial amyloid polyneuropathy III), familial amyloidosis of Finnish type, amyloidosis associated with medullary carcinoma of the thyroid, fibrinogen-associated hereditary renal amyloidosis and lysozyme-associated hereditary systemic amyloidosis. The compound is capable of altering and inhibiting beta-

```
The present invention describes an amyloid modulator compound (1) comprising an aggregation core domain and a modifying group attached to it. (1) has noctropic, neuroprotective, immunosuppressive, antimicrobial, antidiabetic, antipyretic, dermatological, cardiovascular, nephrotropic and auditory activities, and can be used as a natural amyloid aggregation inhibitor and a neurotoxicity inhibitor of natural beta amyloid peptide (beta-AP). (1) are used in the manufacture of a medicament for the diagnosis or treatment of an amyloidogenic disease e.g. Alzhaimer's disease and other clinical occurrences of beta amyloid deposition such as Down's syndrome individuals and in patients with hereditary cerebral haemorrhage with amyloidosis, and for treating a disorder associated with amyloidosis such as familial amyloid polyneuropathy. (1) reduces the toxicity of natural beta-AP aggregates to cultured neuronal cells. (1)
   ö
amyloid protein (beta-AP) aggregation of natural amyloidogenic proteins or peptides when contacted with a molar excess amount of natural beta-APs relative to the modulator. This sequence represents a fragment of the long form of beta-amyloid used in the creation of an amyloid modulator

The present sequence is that of an all-D peptide suitable for use for preparing vaccines for preventing or treating Alzheimer's disease and or preparing vaccines for preventing or treating Alzheimer's disease and cother amploid related disorders in humans. It is based on a portion of amyloid-beta peptide (see AAB82622), and may be modified by removing or inserting 1 or more amino acid residues or non-amino acid residues or non-amino acid fragments. Vaccines of the invention are produced using 'non-self' fragments watchestsed from the unnatural D-configuration amino acids to peptides synthesised from the unnatural D-configuration amino acids to peptides synthesised from the unnatural D-configuration amino acids to a void the drawbacks of self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with at least 1 region of an amyloid protein, e.g. the beta-sheet region or a gargergated to be operative or immunogenic derivative peptides and immunogenic peptides in amyloid-beta peptide all-D peptides and immunogenic peptides in the amyloid-beta peptide and the all-D peptides and 16.16-12 of the amyloid-beta peptide and the all-D peptides for in AAB82623-64. The vaccine elicits a preferential TH-2 or TH-1 response. Or preventing fibrillogenesis and associated cellular toxicity. The amyloid related diseases may be localised amyloidosis e.g. bovine spongiform encephalitis.

Creutzfeldt-Jakob disease, e.g. bovine spongiform encephalitis.

Creutzfeldt-Jakob disease, errapie, crerbral amyloid angiopathy, and protein related diseases, errapie, crerbral amyloidosis associated with chromic infection (e.g. tuberculosis) or chronic infeammation (e.g. tuberculosis) or chronic infeammation (e.g. tuberculosis) or chronic infeament all-between the memodialysis patients. The present all-D peptide was demonstrated to elicit antibody production in rabbits, and peptide was demonstrated to elicit antibody production in rabbits, and peptide was demonstrated to elicit antibody produ

modulator compounds of the invention. Beta-amyloid peptide is a 4

Kilodalton peptide that is the major protein component of amyloid

plaques. Amyloid plaques are present both in the brain lesions, and in

the walls of cerebral blood vessels in Alzheimer's disease patients. The

amyloid modulators of the invention comprise an amyloid equalic protein or

peptide (such as this sequence) coupled directly or indirectly to at

least one modifying group. The modifying group is preferably a cyclic,

heterocyclic, or polycyclic group, such as declain, a cholanyl group,

compounds then modulate the aggregation of these sequences to natural

amyloid proteins or peptides when contacted with the natural

amyloid operies or peptides when contacted with the natural

amyloid proteins or peptides. The modulator compounds can be used

in the treatment of disorders associated with amyloiddosis, such as

familial amyloid polymeuropathy, familial amyloiddosis, such as

familial amyloid proteins encephalopathy, Creutzfeldt-Jakob disease, adult-onset

diabetes, insulinoma, familial Mediterranean fever, familial amyloid

compurpathy with urticaria and deafness, hereditary cerebral haemorrhage

and other types of amyloidosis. The modulators are also useful for the

creatment of disorders associated with beta-amyloidosis, especially

   The invention describes a receptor in a mammalian cell that inhibits regular activation by receptors specific for lipid-based tumour associated antigen. The receptor has cytostatic and antimicrobial properties and is suitable for use in gene therapy. The receptors, methods and compositions are useful for treating a neoplastic disease or tumour (cancer), and infectious diseases. This sequence represents inos polypeptide, a cell surface moiety, the DNA of which can be transfected into a cell with superantigen DNA to generate antitumour immunity.
   for

New antisense oligonucleotides for modulating the expression of inducible nitric oxide synthase in cells or tissues, particularly useful for treating e.g. immunological, cardiovascular or neurological disorders, or
   The invention relates to antisense compounds, especially oligonucleotides, which are targeted to a nucleic acid encoding inducible nitric oxide synthase and which specifically hybridise to and modulate
  The invention relates to two DNA molecules encoding inducible nitric oxide synthase (iNOS) proteins, where the DNA molecules comprise defined sequences of 4041 and 4165 base pairs given in the specification and the proteins have 1144 and no acids. Also claimed are expression vectors containing the DNA molecules, and recombinant host cells containing the vectors. The DNA molecules are useful for producing the recombinant proteins. The present sequence represents inducible nitric oxide, long isoform. (Updated on 25-MAR-2003 to correct PF field.)

   Inducible nitrogen monoxide synthase (iNOS) was isolated from mice, and is encoded by AAO94252. iNOS is homodimer with a mol. wt. of 130 kDA per subunit. The activity of iNOS is independent of calmodulin and cellular calcium levels. Vectors contg. the DNA are used in the treatment or prevention of vascular diseases, high blood pressure, arteriosclerosis, stenosis or restenosis of blood vessels, esp. coronary vessels after for endothelial and brain-derived NOS.

a small inhibitory dsRNA, or a ribozyme. As such, the compositions and methods are useful for diagnosing and treating diseases or conditions associated with abnormal apoptosis in mammalian tissue, such as cancer, inflammation, autoimmune or neurodegenerative disorders. Accordingly, they exhibit cytostatic, antiinflammatory, immunosuppressive and neuroprotective activities. These may also be used for drug screening purposes and in gene therapy. This polypeptide sequence is a human target protein, an enzyme associated with the regulation of apoptosis whose expression is modulated by novel agents of the invention.
   polypeptide. The polypeptide, agonist or an antagonist, antibody, composition, and method are useful for diagnosing and treating an immune related disorder, e.g. systemic lupus erythematosus, rheumatoid arthritis. The present sequence represents a PRO polypeptide.

This invention relates to novel mitochondrial targets that can be used for therapeutic intervention in treating a disease associated with a learner an altered mitochondrial function. Specifically, it refers to a method for identifying proteins of the human heart mitochondrial proteome that are useful for drug screening assays, as well as therapeutic targets. The present invention describes a method for identifying such proteins that can be used in the treatment of various diseases associated with altered mitochondrial function including diabetes mellitus, Huntington's disease, oncephalopathy lactic acidosis and stroke (MEIAS), mycolonic epilepsy ragged red fibre syndrome (MERRR) or cancer. Accordingly, these compositions have neuroprotective, nootropic, antidabetic, antiarthritic, osteopathic, ophthalmological and cycostatic activities. This polypeptide sequence is a human heart mitochondrial protein of the invention.

The invention relates to 2495 novel polynucleotides (I) and their encoded polypeptides, sequences hybridizing to these nucleotides, sequences encoding partial polypeptides and sequences having 70% to 90% identity to the nucleotide and protein sequences. The nucleotides and polypeptides are useful as diagnostic markers or therapeutic target for the diseases or morbid states. They are also useful for treating osteoporosis, neurological diseases, Alzheimer's diseases, Parkinson's diseases, dementia and various cancers. This sequence corresponds to a protein
   osteopathic, neuroprotective, nootropic, antiparkinsonian, cytostatic, gene therapy, diagnostic marker, morbid state, osteoporosis, neurological disease, Alzheimer's disease, Parkinson's disease, dementia,
  Novel 2495 cDNA, useful for treating osteoporosis, neurological diseases, alzheimer's diseases, Parkinson's diseases, dementia and various cancers.
  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176) and the encoded proteins (ABBS7737-ABR2072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

```
The invention relates to novel diagnostic and therapeutic polynuclectides selected from one of the 2722 sequences defined in the specification. A polynuclectide of the invention may have a use in gene therapy. The human cliagnostic and therapeutic polynuclectides (dithp) or polypeptides may be used to diagnostic and therapeutic polynuclectides (dithp) or polypeptides may be used to molecules, e.g. cell proliferative disorders, endocrine autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, dastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp collections and sloo be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, and for somatic or germline invention. Note: The sequence represents a dithp protein of the invention, but was obtained in electronic format directly from WIPO at www.wipo.int/pct/en/sequences/listing.htm

AAKS4951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polymucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) cucleic acids into a host cell and culturing the cell to express the protein and polymucleotides may be used to produce the secreted (I). by inserting the culcience and creat immune/haematopoietic-related diseases, especially cancer metastases of haematopoietic-derived cells. AAK64703 concers and cancer metastases of haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concers from the present invention. AAK54942 to AAK845950 and AAM82169 crepresent sequences used in the exemplification of the present invention
  Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis.

   The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polyneptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, immunomodulatory activity and activity, tissue growth factor activity, immunomodulatory activity and activity, insue growth factor activity, immunomodulatory activity and activity, insue growth factor activity, immunomodulatory activity and inflammation. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
   Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.

The present sequence represents the calmodulin-binding site of mouse iNOS amino acid sequence. The present invention describes endothelial nitric oxide synthase (eNOS) mutants having one or more mutations in an amino acid sequence corresponding to a tunctional domain of a mammalian eNOS.

At least one of the mutations is at a position corresponding to an amino acid sequence corresponding to an amino acid substitution to Ala or Asp. Also described: (1) an isolated eNOS polypeptide mutant that is substantially concluded the novel eNOS polypeptide mutant; (2) an isolated polymucleotide mutant; (3) a recombinant vector comprising the polymucleotide operably linked to at least one regulatory sequence; (4) a planmaceutical composition comprising the polypeptide mutant; (5) a binding partner of the polypeptide mutant; (6) a binding partner of the polypeptide mutant; (6) a diministering the polypeptide mutant or the polymucleotide coll the cell; (6) a diministering the polypeptide mutant or the polymucleotide to the cell; (8) diagnosing a condition associated with aberrant eNOS activity indicative of the medical condition; and (9) prophylactic and chicactive patient with the polymucleotide, and detecting a level of eNOS activity by administering a level of eNOS activity indicative of the medical condition; and (9) prophylactic and chicactive patient. The eNOS mutant has vasoriated with aberrant eNOS activity by administering the polymetride mutant or polymucleotide to the patient.   The present sequence is a polypeptide encoded by one of a large number of 5' ESTB derived from mRNAs encoding secreted proteins. The 5' ESTB were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTB are not well suited for isolating cDNA pequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTB are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTB
   are also used in diagnostic, forencic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors

che coding allergen specific T-cell epitope peptide, inserting a DNA into the variable region of storage protein of the plant and expressing the peptide in the transgenic plant. The invention describes the accumulation of human T cell epitope in rice albumen, a method of accumulation of human T cell epitope in rice albumen, a method of inserting the 7crp in seeds, a method of inserting the 7crp in the the variable region of glutelin (the major storage protein of rice), and expressing and accumulating 7crp as part of the glutelin. The rice capable of producing the 7crp is useful as an edible vaccine against is Cryjl or Cryjl. The T-cell epitope is integrated on an edible region such as the seed of a plant. The method of the invention is useful for producing a plant accumulated with allergen specific T-cell epitope, and manufacturing a transgenic plant, preferably rice, integrated with 1-cell epitope. The method is useful for preventing or treating allergic disease cuch as hay fever. The method enables the production of allergen specific T-cell epitope at a low cost and also reduces the amount for administration. The allergen specific T-cell epitope at allergen specific T-cell epitope accumulated in a cadministration. The allergen specific T-cell epitope accumulated in a cadministration. The allergen specific T-cell epitope accumulated in a cadministration. The allergen specific T-cell epitope accumulated in a cadministration. The allergen specific T-cell epitope accumulated in a cadministration.

oxide synthase (eNOS). The threonine residue at position 495 of eNOS is phosphorylated by AMP-activated protein kinase (AMPK) in the absence of Ca2+-CaM, Phosphorylation results in inhibition of eNOS. In the presence of Ca2+-CaM, phosphorylation by AMPK occurs predominantly at Ser-1177 and eNOS is activated. Modulators which activate AMPK may be used in the metabolism, and improving nutrient and oxygen supply to the myocytes. They may also be used for the treatment of pulmonary hypertension and
   The invention describes a method of creating critical limb ischaemia (CLI) comprising administering to a patient a polynucleotide encoding a mammalian eNOS (endothalial nitric oxide synthase) polypeptide. Also described are: a method for treating angiogenesis by administering to patient a polynucleotide encoding eNOS; and ameliorating microvascular dysfunction by administering to the patient the polynucleotide encoding the eNOS polypeptide. The method is useful for treating critical limb ischaemia or angiogenesis, or ameliorating a microvascular dysfunction. This is the amino acid sequence of a human neuronal nitric synthase

This invention relates to a DNA (I) having a sequence under the control of a storage protein promoter, chosen from a sequence encoding storage protein signal sequence at the 5' end of a sequence encoding allergen specific T cell epitope peptide and/or a sequence encoding vesicle anchoring signal sequence at the 3' end, and a DNA sequence encoding a nothering signal sequence at the 3' end, and a DNA sequence encoding a chopeptide having allergen specific T-cell epitope peptide inserted in the variable region of a storage protein. Also disclosed is a vector (II) for T-cell epitope accumulating protein, and a method of accumulating allergen specific T-cell epitope in a plant. The method involves introducing (I) or (II) to a plant, obtaining DNA encoding a storage protein signal sequence to the 5' end and/or a vesicle anchoring signal sequence to the 3' end of the obtained DNA, and expressing the DNA in a plant under the control of a storage protein promoter, or obtaining DNA

The invention relates to a method for prevention and/or treatment of an anyloid-related disease which comprises administration of an all-D amyloid-beta peptide. The method is used for preventing and/or treating Alzheimer's and other amyloid related disease e.g. cerebral amyloid angiopathy; for altering serum levels of amyloid-beta in a mammal and favours the clearance of soluble amyloid-beta in a mammal, and reducing or inhibiting the formation of plaques. It is also used for treating AA (reactive) amyloid diseases including confilmmentory diseases e.g. rheumatoid arthritis, juvenile chronic arthritis, ankylosing spondylitis, psoriatis psoriatic arthropathy, carthritis, ankylosing spondylitis, psoriatis, juvenile chronic arthritis, ankylosing spondylitis, psoriatis, psoriatic arthropathy, cifecase. AA deposite are also produced as a result of chronic microbial cifections (preferably leprosy, tuberculosis, bronchiectasis, decubitus culcers, chronic pyelonephritis, osteomyelitis and Whipple's disease).

Certain malignant neoplasms can also result in AA fibril amyloid deposits cincluding Hodgkin's lymphoma, renal carcinoma, carcinomas of gut, lung and uroganital tract, basal cell arxinoma and hairy cell leukaemia. The invention is an Abeta peptide used to illustrate the method of the

The present sequence is that of an all-D peptide suitable for use in preparing vaccines for preventing or treating Alzheimer's disease and or preparing vaccines for preventing or treating Alzheimer's disease and cother amyloid related disorders in humans. It is based on a portion of amyloid-beta peptide (see AABS262), and may be modified by removing or inserting 1 or more amino acid residues or non-amino acid fragments. Vaccines of the invention are produced using 'non-self' peptides synthesised from the unnatural D-configuration amino acids to avoid the drawbacks of 'self' proteins. The all-D peptides need not be aggregated to be operative or immunogenic. They preferably interact with at least 1 region of an amyloid protein, e.g. the beta-sheet region or GAG-binding after region, the amyloid-beta peptide, or their immunogenic fragments, protein conjugates, immunogenic derivative peptides and immunogenic peptidemimetics. Examples include all-D peptides and immunogenic peptidemimetics. Examples include all-D peptides and immunogenic peptide and the all-D betivative peptides or the vaccine elicits a preferential TH-2 or TH-1 response, preventing fibrillogenesis and associated cellular toxicity. The amyloid corresponding to residues 1-42, 1-40, 1-35, 1-28, 1-7, 10-16, 16-21 and the ABB3623-64. The vaccine elicits a preferential TH-2 or TH-1 response, proventing fibrillogenesis and associated cellular toxicity. The amyloid correlated diseases may be localised amyloidosis, e.g. diabetes type II, cheurodegenerative diseases, e.g. bovine spongiform encephalitis, created diseases, e.g. bovine spongiform encephalitis, chronic infection (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) or chronic inflammation (e.g. tuberculosis) created (PMF) and systemic amyloidesis found in long-term haemodialysis patients
   Preventing/treating amyloid-related disease, especially Alzheimer's disease, comprises administering antigenic all-D peptide, eg. as vaccine, which elicits production of antibodies to prevent fibrillogenesis and

   The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed in diagnostics as expressed sequence tags for identifying expressed activity of (II) as useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in
  diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in
amyloid-related conditions, thereby allowing earlier treatment and hence prevention of the undealrable effects of such disorders. Sequences ADY37921-ADY37947 and ADY37992 represent peptides which may be used as the amyloid-targeting moiety in an imaging agent of the invention.

   ö
   Peptides AAB48474-B48496 are antifibrillogenic agents that can be used for inhibiting amyloidosis and/or for cytoprotection. The peptides of AAB48474-B48496 cause the breakdown of amyloid deposits and are therefore useful for treating amyloidosis disorders such as Alzheimer's disease. Peptides AAB48474-B48496 were identified from the glycosaminoglycan binding region and the prot-prot interaction region of the human amyloid
  Antifibrillogenic agent useful for inhibiting amyloidosis and/or for cytoprotection for treating amyloidosis disorders, comprises a peptide, its isomer or peptidomimetic.
  Noctropic; neuroprotective; antifibrillogenic; amyloidosis inhibition; cytoprotection; amyloid deposit degradation; amyloidosis disease.

The invention relates to an amyloid-targeting imaging agent. The imaging agent comprises an amyloid targeting molety (such as a peptide) joined to a labeling molety and is preferably able to cross the blood-brain barrier. The invention also relates to a kit for preparing a radiopharmaceutical preparation from the imaging agent of the invention, a method for imaging amyloid deposition in a patient and a method for imaging amyloid deposition in a patient. The amyloid-targeting languaged is useful in imaging to diagnose amyloid-targeting languaged is useful in imaging to diagnose amyloid-targeting languaged is useful in imaging to diagnose amyloid-targeting languaged is useful in imaging to diagnose amyloid-targeting languaged is useful in imaging to diagnose amyloid-targeting languaged is transmissible mink encephalopathy, cransmissible mink encephalopathy, bovine spongiform encephalopathy (BSE), inflammation-associated amyloid, bovine spongiform encephalopathy (BSE), inflammation-associated amyloid, contransmissible cerebral amyloidosis (e.g. Alzheimer's disease), prion-mediated diseases, dialysis-related amyloidosis, light chain-related mediated diseases, dialysis-related amyloidosis, light chain-related conditions, thereby allowing earlier treatment and hence the amyloid-related conditions, thereby allowing earlier treatment and hence or amyloid-targeting moiety in an imaging agent of the invention.
  ö
   New amyloid-targeting imaging agent, useful for diagnosing an amyloid-related condition, e.g. Creutzfeld-Jakob disease, bovine spongiform encephalopathy, primary amyloidosis or Alzheimer's disease.
